## What is Ortho-K?

Ortho-K is a process using specially designed rigid gas permeable (RGP) contact lenses to gently reshape the front of the eye (cornea) *while you sleep* to eliminate long or short sightedness.

Ortho-K provides great daytime vision without using spectacles or contact lenses and you don't have to visit a surgeon! The lens materials are designed to allow enough oxygen required to be safe and comfortable.

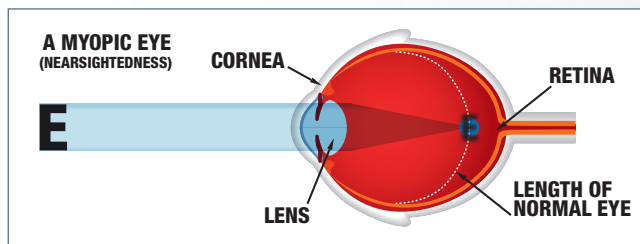

Ortho-K is also proven to reduce and even stop the progression of short sightedness.

## Myopia Control and Ortho-K

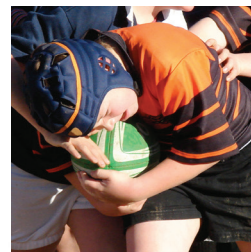

Ortho-K is proven to be the most successful method of preventing short sighted progression to date. Slowing the progression of myopia is important especially for children with parents who are short sighted.

By correcting the short sightedness with Ortho-K lenses prevents the eye from elongating and potential risks to eyesight as the tissues of the eye stretch.

## Who can benefit from Ortho-K?

- People wanting to be free of spectacles or contact lens wear
- Children with family history of myopia (short sightedness) to prevent progression
- Industry workers in dusty or dry environments
- Adults and children participating in sports – great for watersports or contact sports

*Whatever activity you wish to pursue,  
enjoy it free from the constraints of  
glasses or contact lenses!*
